The Data

1.

The screenshot shows a Discord interface for a private group named "Asian Vibes In Denver" with 1.3K members. A "Download" modal is open in the center, allowing users to export data. The modal includes options for the date range (Last 60 days), file format (Excel (.xlsx)), and a list of details to download. The background shows a sidebar with navigation links and a main area with two line charts.

 2. Instagram Stories (csv)
 3. Facebook Posts (csv)
 4. General Group insights (xlsx)
- Updated csv's for each of these

Data Cleaning and Preparation

Issues with the CSVs

1. Appending the original tables with updated tables
2. Removing unnecessary columns
3. Encoding for Machine Learning

Issues with the Demographic Data

1. Tableau not being able to read cities
2. Where Facebook get location data

Insight 1

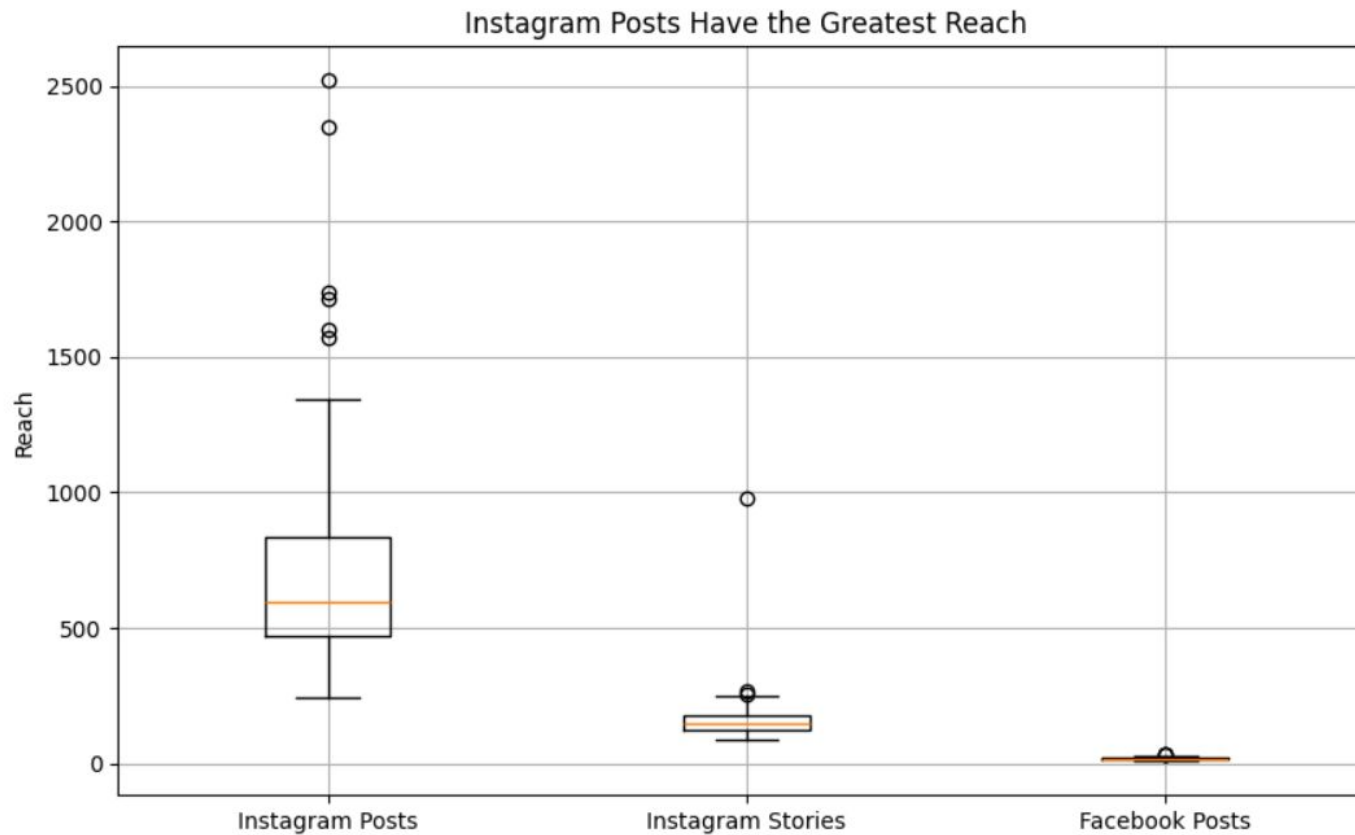

Facebook location is not
trustworthy

Insight 2

Women Age 25-34 Dominate AVID

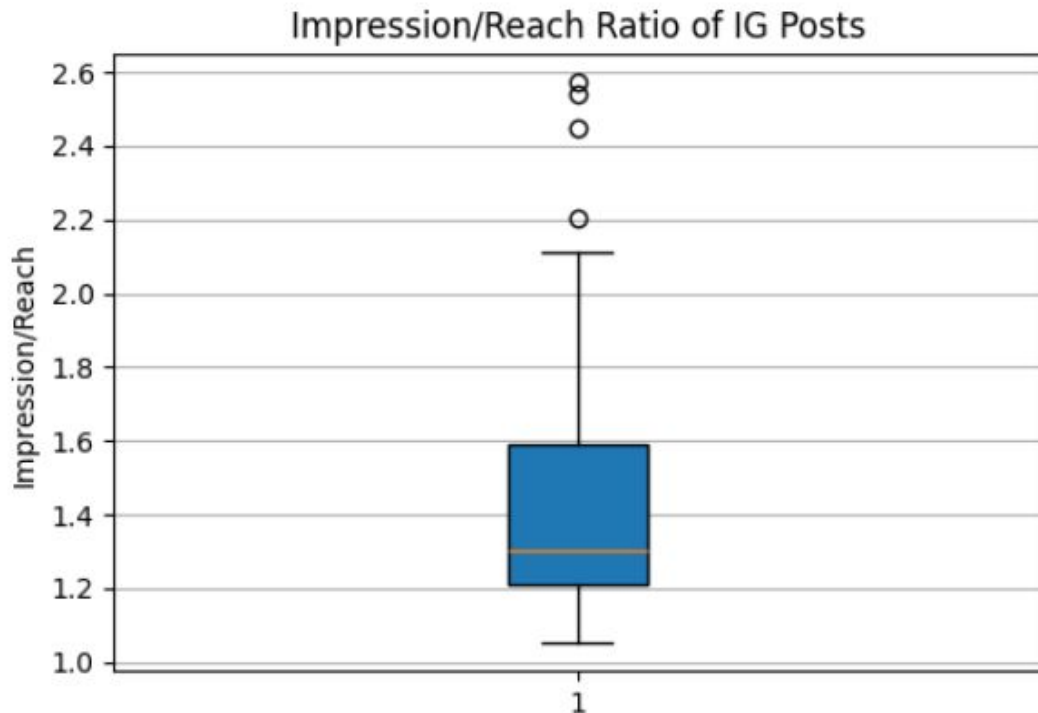

Insight 3

Insight 4

Higher Impressions compared to Reach means better engagement

Machine Learning

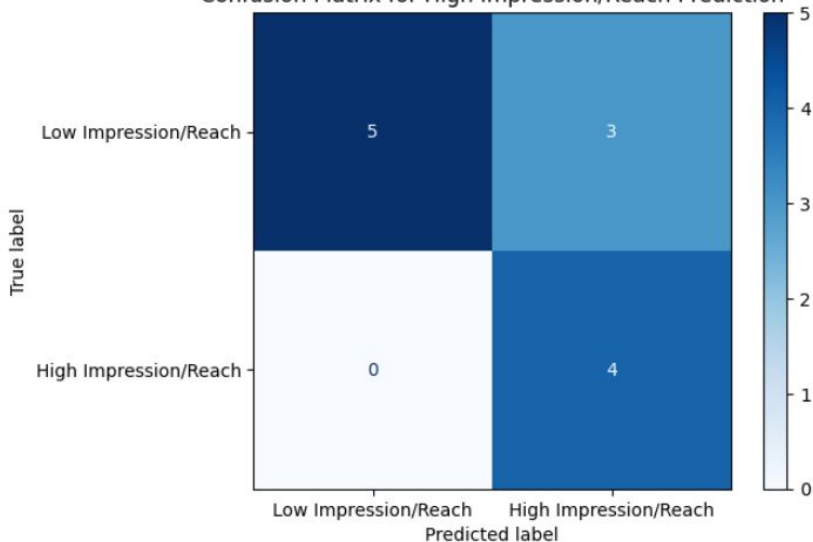

Goal and Method

1. Day of the week, content type → impressions/reach
2. Random Forest Classifier to predict if posts can hit Impressions/Reach > 1.5
3. Accuracy: 75%

Results

Accuracy: 75%

Confusion Matrix for High Impression/Reach Prediction

Feature Importance for Predicting High Impression/Reach

Saturdays have the best Impression/Reach

Takeaways and Next Steps

Takeaways

1. Content for 25-34 yr olds, particularly women
2. Instagram Posts have greatest reach and have great potential for high engagement
3. Day of the week matters

Next Steps

1. Better Data Collection
 - Real world attendance data
 - Connect Discord + other social medias
 - Frequent updates to the data from Meta
2. Connect online engagement to real attendance
3. Find a content's growth over time

Thank You
